

AMENDMENTS TO THE CLAIMS:

This listing replaces all prior versions, and listings, of claims in the application:

1. (Currently Amended) A seat recline mechanism for a child swing, comprising:
at least one latch adapted to be positioned on a side of a seat back of the swing; and
first and second latch-receiving members adapted to be positioned on a hanger arm of
the swing, wherein the at least one latch is configured to engage the first latch-receiving
member to position the seat back in a first in-use position, and the at least one latch is
configured to engage the second latch-receiving member to position the seat back in a second
in-use position in which the seat back is adjusted rearward relative to the first in-use position.
2. (Currently Amended) A ~~child-swing~~ seat recline mechanism according to claim 1,
wherein the at least one latch is positioned on a side of the seat back for engagement with the
first and second latch-receiving members positioned on the hanger arm.
3. (Currently Amended) A ~~child-swing~~ seat recline mechanism according to claim 2,
wherein the at least one latch is molded with the seat back.
4. (Currently Amended) A ~~child-swing~~ seat recline mechanism according to claim 2,
wherein the at least one latch is releasably attached to the seat back.
5. (Original) A seat recline mechanism according to claim 1, wherein the at least one
latch comprises a pair of latches, one positioned on each side of the seat back for engagement
with a respective hanger arm of the swing.
6. (Original) A seat recline mechanism according to claim 1, wherein the first and
second latch-receiving members comprise first and second ribs positioned on the hanger arm.

7. (Original) A seat recline mechanism according to claim 6, wherein the first rib and the at least one latch engage when the seat back is in the first in-use position, and the second rib and the at least one latch engage when the seat back is in the second in-use position.

8. (Original) A seat recline mechanism according to claim 1, wherein the first and second latch-receiving members comprise first and second sockets formed on the hanger arm.

9. (Original) A seat recline mechanism according to claim 1, wherein the at least one latch engages the first socket to hold the seat back in the first in-use position, and the at least one latch engages the second socket to hold the seat back in the second in-use position.

10. (Original) A seat recline mechanism according to claim 1, wherein the at least one latch and the first and second latch-receiving members are configured such that the at least one latch must be actuated to adjust the seat back from the second in-use position to the first in-use position.

11. (Currently Amended) A child swing comprising:
a frame;
a seat including a seat back;
at least one hanger arm that connects the seat to the frame; and
a seat recline mechanism that engages the seat ~~back-with~~ back and the hanger arm,
wherein the seat back is positionable in a first in-use position and in a second in-use position in which the seat back is adjusted rearward relative to its first in-use position, and wherein the seat recline mechanism must be actuated to adjust the seat back from the second in-use position to the first in-use position.

12. (Currently Amended) A child swing ~~according to claim 11, comprising:~~
a frame;
a seat including a seat back;
at least one hanger arm that connects the seat to the frame; and
a seat recline mechanism that engages the seat back with the hanger arm,
wherein the seat back is positionable in a first in-use position and in a second in-use
position in which the seat back is adjusted rearward relative to its first in-use position, and
wherein the seat recline mechanism must be actuated to adjust the seat back from the second
in-use position to the first in-use position, and

wherein the seat recline mechanism includes at least one latch positioned on one of the seat back and the hanger arm, and first and second latch-receiving members positioned on the other of the seat back and the hanger arm, wherein the at least one latch is configured to engage the first latch-receiving member to position the seat back in its first in-use position, and the at least one latch is configured to engage the second latch-receiving member to position the seat back in its second in-use position.

13. (Currently Amended) A seat recline mechanism for a child swing, comprising:
at least one latch adapted to be positioned on one of a seat back of the swing and a hanger arm of the swing; and

first and second latch-receiving members adapted to be positioned on the other of the seat back and the hanger arm,

wherein the at least one latch is configured to engage the first latch-receiving member to position the seat back in a first in-use position, and the at least one latch is configured to engage the second latch-receiving member to position the seat back in a second in-use position in which the seat back is adjusted rearward relative to the first in-use position.

14. (Currently Amended) A ~~child swing~~ seat recline mechanism according to claim 13, wherein the at least one latch is positioned on a side of the seat back, and the first and second latch-receiving members are positioned on the hanger arm.

15. (Currently Amended) A ~~child swing~~ seat recline mechanism according to claim 14, wherein the at least one latch is molded with the seat back.

16. (Currently Amended) A ~~child-swing~~ seat recline mechanism according to claim 14, wherein the at least one latch is releasably attached to the seat back.

17. (Original) A seat recline mechanism according to claim 13, wherein the at least one latch comprises a pair of latches, one positioned on each side of the seat back for engagement with a respective hanger arm of the swing.

18. (Original) A seat recline mechanism according to claim 13, wherein the first and second latch-receiving members comprise first and second ribs positioned on the hanger arm.

19. (Original) A seat recline mechanism according to claim 18, wherein the first rib and the at least one latch engage when the seat back is in the first in-use position, and the second rib and the at least one latch engage when the seat back is in the second in-use position.

20. (Original) A seat recline mechanism according to claim 13, wherein the first and second latch-receiving members comprise first and second sockets formed on the hanger arm.

21. (Original) A seat recline mechanism according to claim 13, wherein the at least one latch engages the first socket to hold the seat back in the first in-use position, and the at least one latch engages the second socket to hold the seat back in the second in-use position.

22. (Original) A seat recline mechanism according to claim 13, wherein the at least one latch and the first and second latch-receiving members are configured such that the at least one latch must be actuated to adjust the seat back from the second in-use position to the first in-use position.

23. (New) A child swing comprising:
a frame;

a seat including a seat back, the seat back being positionable in a first in-use position and in a second in-use position in which the seat back is adjusted rearward relative to its first in-use position;

at least one hanger arm that connects the seat to the frame;

at least one latch positioned on one of the seat back and the hanger arm; and

first and second latch-receiving members positioned on the other of the seat back and the hanger arm,

wherein the at least one latch is configured to engage the first latch-receiving member to position the seat back in its first in-use position, and the at least one latch is configured to engage the second latch-receiving member to position the seat back in its second in-use position.
